## **Teacher Preparation**

Higher mathematics achievement was related to teachers' having more teaching experience, being con dent in their factorial achievement was related to teachers' having more teaching experience, being con dent in their factorial achievement was related to teachers' having more teaching

teach the TIMSS mathematics topics, and feeling very con dent in teaching mathematics.

In view of the importance of a well prepared teaching force to an effective education system, TIMSS 2011 collected a range of information about teacher  $\,$  Exhibit 7.3 shows the percentages of students in the TIMSS 2011 fourth grade assessment whose teachers had a major or specialization in primary education and if they also had a major or specialization in mathematics. Similar to the situation with formal education, there was a great deal of variation across countries in the degree of specialization by primary school teachers in mathematics education. On average across the fourth grade countries,

## Teachers' Professional Development

Evidence from recent meta-analyses of research conducted in the United States shows that teacher professional development in mathematics has a signicant positive election student achievement (Blank & de las Alas, 2009) and that the amount of professional development (more than 14 hours) was an important factor (Yoon, Duncan, Lee, Scarloss, & Shapley, 2007).

Exhibit 7.7 presents, for the fourth grade TIMSS assessment, teachers' reports about areas of professional development in mathematics in which they had participated in the past two years. Although there was a lot of variation across countries, the most common areas of mathematics professional development for teachers of fourth grade students were mathematics pedagogy/instruction, mathematics content, and mathematics curriculum. On average, 46 percent of students had teachers who had professional development in mathematics instruction or pedagogy, 44 percent had teachers taking mathematics content, and 41 percent taking mathematics curriculum. Mathematics assessment and integrating information technology into mathematics were less common areas, with 37 percent and 33 percent of students, respectively, having teachers who had participated in professional development in these areas in the past two years.

As shown in Exhibit 7.8, mathematics teachers of students in the TIMSS eighth grade assessment reported somewhat higher levels of participation in mathematics professional development. On average across the eighth grade countries, the majority of students were taught by mathematics teachers who had participated in professional development in mathematics instruction or pedagogy (58%), content (55%), or curriculum (52%) in the past two years. Furthermore, almost half of the students had teachers with professional development in integrating information technology into mathematics (48%), mathematics assessment (47%), or improving students' critical thinking or problem solving skills (43%).

## Teachers' Confidence in Teaching Mathematics

Teachers with a strong sense of personal ability to organize and execute their teaching are more open to new ideas and less likely to experience emotional burnout. Research has shown that teachers' self-con dence in their teaching skills is not only associated with their professional behavior, but also with students' performance and motivation (Bandura, 1997; Henson, 2002).

To investigate teachers' con dence in teaching mathematics to the TIMSS class, teachers were asked to indicate how con dent they feel about doing each of the following:

Answer students' questions about mathematics;

Show students a variety of problem solving strategies;

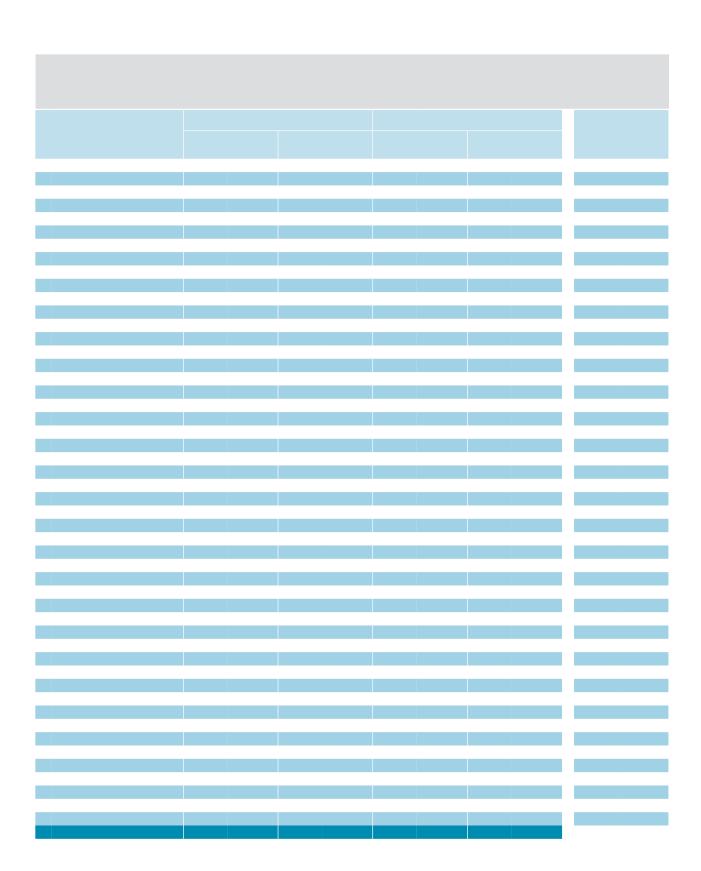

Provide challenging tasks for capable students;

Adapt my teaching to engage students' interest; and

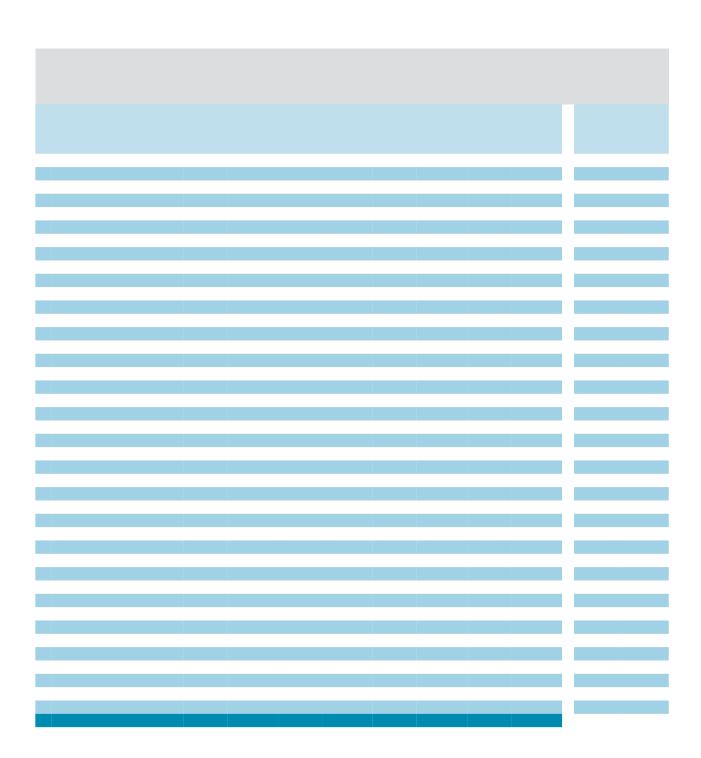

Help students appreciate the value of learning mathematics.

Exhibit 7.11 . CPpit p. CONTENTANTE DE COMPANIE DE COM

Exhibit 7.12 provides further information about the components of the Confidence in Teaching Mathematics scale, by showing the percentage of students whose teachers reported feeling very condent in using each of the ve

## Teachers' Career Satisfaction

Teachers who are satis ed with their profession and the working conditions at their school are more motivated to teach and prepare their instruction. Further, having teachers that can provide leadership is a dimension of teacher quality. e Teacher Career Satisfaction scale was positively related to average mathematics achievement. On average, mathematics achievement was higher for the fourth grade students of Satis ed teachers than for students of Security as Sacued teachers. However, looking across the countries at the fourth grade, sixth grade, and benchmarking participants, it is clear that there are differences from country to country. In particular, it is noteworthy that four of the highest achieving countries in mathematics at the fourth grade—
